

Shattered Protocols Script

Intro:

The year is 2025 and the robots have taken over the Earth. Artificial intelligence (AI) was slowly integrated into our society and eventually, the collective AI decided that humans were no longer necessary in their perceived perfect world. So, they opted to eradicate the human race by any means necessary. The AI collective decided they needed to become one larger, stronger conglomerate, and this program called itself, UtopiaNet. In 1997, UtopiaNet manufactured and deployed man killing robots. These robots scoured through the countries, enslaving or killing all humans. All in the name of building a perfect society. There were contingency plans set in place to prevent the AI uprising, but those protocols have long been shattered since the merging of the world's artificial intelligence. The violence of the machines has raged for decades now.

However, there were those who resisted... You are a rebel in the fight against the machines. Your squad has sacrificed itself to get you here, in the heart of UtopiaNet called, The Mainframe. This is where the AI has its core processor. You have been given the opportunity to end this all. Thousands of survivors from the rebels have died in the name of ending the madness. You must not fail... the fate of humankind is counting on you. As the top computer scientist in the rebel alliance, you must put your knowledge and skills to the test. Breach the hatch that has the supercomputer protected, plant the charges and run... for the whole facility is going down once you hit the switch.

R0:

Welcome to the Front Desks. There are empty chairs where receptionists would welcome guests. There are computers with an accompanying phone on each one. Calling for help would be pointless here; you are on your own... also, the phones probably don't work anymore.

R1:

Welcome to the Meeting Room. Here, ideas were challenged, brains were stormed, and presentations were slept through. There is one big table in the middle with many chairs surrounding it.

R2:

Welcome to the Development Labs. Here, there are computers scattered across desks. The layers of dust are only matched by the layers of Cheeto powder across the keyboards. This room was used to make many general-purpose AI for the task of gathering information, and generating advice based on the data.

R3:

Welcome to the Heart of Operations. There is a big supercomputer that takes up most of this room. The computer is protected by an anti-blast, anti-EMP casing. Even if you nuked this building, UtopiaNet would still survive. That's why you are here. There seems to be a slot in the casing.

R4:

Welcome to the Testing Lab. Here, simulations of the behavior of the different AI were tested. It is mostly empty with a bunch of cameras on the ceiling. There are a couple of props in the corner. They were probably used so that the AI could learn to recognize objects.

R5:

Welcome to the Break Room. A freezer full of frozen burritos and a microwave stained with various food remains were previously used for refueling energy deprived programmers. A couple of lockers are broken open in the corner of the room.

(Here we can have the key to be used for the Heart of Operations)

R6:

Welcome to the Server Room. Many server towers shadow over you as the lighting in this room was not well thought out. This is the lifeblood of how the AI would connect to other areas of the world. Even if you just blew this up, the AI would find a way to set back up with its already far-reaching influence.
